Wind Energy

harnessing the power of Nature

Climate change is occurring now, and is already affecting our natural environment, our national security and our quality of life. But, there are effective, achievable solutions for addressing the crisis. An important step is to repower America by producing 100 percent of our country's electricity from energy sources with zero carbon emissions -- within 10 years. Making this switch will generate millions of good American jobs, cut energy costs, safeguard national security, and protect the climate. We need business and government leaders at all levels to help adopt policies and practices now that will enable America to switch to energy sources with zero carbon emissions. We need policies that encourage energy efficiency, renewable energy, and a unified national electricity grid.

We can repower America in a short time frame. We put a man on the moon in just eight years. We quickly retooled our factories to produce tanks, trucks and airplanes for World War II. We mobilized for civil rights and women's suffrage. We've done this before, and we can do it again.
